

UX Design

Faculty of Engineering, Design and Computing, Department of Information Technology

When

6 February 2022 - 14 April 2022
Class days: 4 days full days (1 day off)
(from 9 am until 5 pm)

General Information

Audience: Bachelor ICT 3rd year with experience in User interface Design and Interaction Design.
15 European Credits (10 weeks)
Where: Haarlem, the Netherlands

Teachers

Teachers of the Computer Science Haarlem study program and guest lectures and workshops by UX-professionals.

Strategies and teaching activities

- Workshops by experts
- Do research with your project group
- Lectures on theory combined with practical exercises

About the course

Within the fast-growing digital world new software is released every day. A lot of these desktop and ever-growing mobile applications are targeted to specific user groups as tooling for a specific problem they might encounter.

These applications range from E-health tools for supporting specific therapies for people at home to software to stimulate people to choose environment-friendly routes by avoiding schools and densely populated areas while traveling by car.

In order to make these tools really useful their operation should be flawless, and their interface should be clear and understandable. A great design however finds its base in researching the human angle, taking into account the people's own perspectives, daily lives and struggles. Meeting them, interviewing them, talking about their processes, needs and experiences with (perhaps) other tools.

All this knowledge is then combined into a design that is based in reality, offering a fitting user experience (UX) for the intended audience.

In this course we try to emulate real life conditions by offering a methodology for students to find and sort information to be able to come up with the best design solutions.

Students will work on real live issues from real clients. Their solutions should be based in research and visualized in a feasible and testable prototype.

Competences

Analysing:

- Researching target group, objective, context, information and communication needs, visualization, usability and use, and relate this to trends in ICT and/or digital media products
- Mapping the relevant aspects of a complex problem and making well-founded choices of research methods and instruments.
- Collecting, analysing and interpreting the relevant research data link substantiated conclusions and recommendations to research results.

Designing

- Designing a user interface based to support on a specific functionality, interaction form, style and/or service, including user experience and usability tests.
- Developing a prototype, taking into account quality requirements and stakeholders

Realising

- Prototyping and testing of user interface elements to support the goals set out by stakeholders

Professionalize:

- Developing creativity and problem-solving ability to complex user interface issues
- Developing self-steering abilities, planning and organization

Goals

The student is able to:

- Design and develop proposals for user interfaces based on a user centered design methodology.
- Create testable prototypes
- Apply these skills in live projects

Questions

Eef Stavenuiter, Haarlem

eef.stavenuiter@inholland.nl

Details of assessments

- Students will work with real clients on actual projects, designing real solutions for specific target audience.
- Student will work on three projects where the duration spans from 1 to 4 weeks.
- Students will be working in different groups
- There is no written exam. Students will be presenting the result of their work for a comity of experts and the client.

All assignments must be completed with a sufficient grade
